BIOCHEMISTRY

25-Hydroxy Vitamin D

TEST NAME	RESULTS	UNITS	BIOLOGICAL REFERENCE INTERVALS
25-Hydroxy Vitamin D Method : CLEIA	16.8	ng/ml	Deficiency : <10 Insufficiency : 10-30 Sufficiency : 30-100 Potential Toxicity : >100

Interpretation

Vitamin D, the sunshine vitamin, is now recognized not only for its importance of bone health in children and adults, but also for other health benefits including reducing risk of chronic diseases including autoimmune diseases, common cancer and cardiovascular disease. Vitamin D made in the skin or ingested in the diet is biologically inert and requires two successive hydroxylations first in the liver on carbon 25 to form 25-hydroxyvitamin D [25(OH)D], and then in the kidney for a hydroxylation on carbon 1 to form the biologically active form of vitamin D, 1,25-dihydroxyvitamin D [1,25(OH)2D]. With the identification of 25(OH)D and 1,25(OH)2D, methods were developed to measure these metabolites in the circulation. Serum 25(OH)D is the barometer for vitamin D status. Serum 1,25(OH)2D provides no information about vitamin D status and is often normal or even elevated due to secondary hyperparathyroidism associated with vitamin D deficiency. Most experts agree that 25(OH)D of < 10 ng/ml is considered to be vitamin D deficiency whereas a 25(OH)D of 10-30 ng/ml is considered to be insufficient. The goal should be to maintain both children and adults at a level > 30 ng/ml to take full advantage of all the health benefits that vitamin D provides.

TEST NAME	RESULTS	UNITS	BIOLOGICAL REFERENCE INTERVALS
TriIodothyronine Total (TT3) <i>Method : ECLIA</i>	103.42	ng/dL	60-181 51 yrs - 99 yrs
Thyroxine (TT4) <i>Method : ECLIA</i>	8.63	ug/dL	1 Yrs - 5 Yrs :7.3-15.0 6 Yrs - 10 Yrs :6.4-13.3 11 Yrs - 15 Yrs : 5.6-11.7 16 Yrs - 100 Yrs : Adults: 3.2-12.6 Pregnancy : 3.2-18.9
Thyroid Stimulating Hormone (TSH) <i>Method : electrochemiluminescence</i>	2.09	μIU/mL	0.52 - 16.0 : 1 Day - 30 Days 0.46 - 8.10 : 1 Mon - 5 Yrs 0.36 - 5.80 : 6 Yrs - 18 Yrs 0.35 - 5.50 : 18 Yrs - 55 Yrs 0.50 - 8.90 : >55 yrs Pregnancy Ranges Ist Tri :0.1 - 2.5 IInd Tri :0.2 - 3.0 IIIRD Tri:0.3 - 3.0

Interpretation

Thyroid stimulating hormone (TSH) is a pulsatile hormone and is subjected to circadian variation, reaching peak levels between 2-4 am at minimum between 6-10 pm. The variation of the order may be 50%, hence the time of the sample collection has influence on the measured serum concentrations. The TSH values <0.03 μIU/mL need to be correlated due to presence of rare TSH variant in some individuals. Low TSH results may indicate hyperthyroidism. Elevated TSH results may indicate hypothyroidism.

BIOCHEMISTRY

Vitamin - B12

TEST NAME	RESULTS	UNITS	BIOLOGICAL REFERENCE INTERVALS
Vitamin - B12	258	pg/ml	211-911
Method : ECLIA			

Interpretation

Vitamin B12 and folate are critical to normal DNA synthesis, which in turn affects erythrocyte maturation. Vitamin B12 is also necessary for myelin sheath formation and maintenance. The body uses its B12 stores very economically, reabsorbing vitamin B12 from the ileum and returning it to the liver so that very little is excreted. Clinical and laboratory findings for B12 deficiency include neurological abnormalities, decreased serum B12 levels, and increased excretion of methylmalonic acid. The impaired DNA synthesis associated with vitamin B12 deficiency causes macrocytic anemias. These anemias are characterized by abnormal maturation of erythrocyte precursors in the bone marrow, which results in the presence of megaloblasts and in decreased erythrocyte survival. Pernicious anemia is a macrocytic anemia caused by vitamin B12 deficiency that is due to lack of intrinsic factor. Low vitamin B12 intake, gastrectomy, diseases of the small intestine, malabsorption, and trans-cobalamin deficiency can also cause vitamin B12 deficiency.

BIOCHEMISTRY

Glycosylated Hemoglobin (HbA1c)

TEST NAME	RESULTS	UNITS	BIOLOGICAL REFERENCE INTERVALS
Glycosylated Hemoglobin (HBA1c) <i>Method : HPLC</i>	4.2		Non-Diabetic : 4.0-5.6 % Diabetes : >6.5 % Good Control : 6.5-7.0 Poor Control : >7.0
Approximate mean plasma glucose	74	mg/dL	68-128

Interpretation

NOTE : Approximate mean plasma glucose value is calculated from HBA1c value and it indicates Average Blood Sugar level over past three months.

The hemoglobin A1c test -- also called HbA1c, glycated hemoglobin test, or glycohemoglobin -- is an important blood test used to determine how well your diabetes is being controlled. Hemoglobin A1c provides an average of your blood sugar control over a six to 12 week period and is used in conjunction with home blood sugar monitoring to make adjustments in your diabetes medicines. Hemoglobin is a substance within red blood cells that carries oxygen throughout your body. When your diabetes is not controlled (meaning that your blood sugar is too high), sugar builds up in your blood and combines with your hemoglobin, becoming "glycated." Therefore, the average amount of sugar in your blood can be determined by measuring a hemoglobin A1c level. If your glucose levels have been high over recent weeks, your hemoglobin A1c test will be higher. The amount of hemoglobin A1c will reflect the last several weeks of blood sugar levels, typically encompassing a period of 120 days.
